

WHUNDO PROJECT - AYSHIA ZINC DISCOVERY (*January 2006*)

After the successful initial fixed loop TEM trials at West Whundo (8/2005), which clearly delineated the known VMS mineralization, it was proposed that the prospective sequence both east and west of the known mineralization be surveyed. Given the shallow to moderate dip in the area several large fixed loop surveys were planned along strike and resultant data defined several new bedrock conductors of immediate interest.

Drill testing of the initial northeastern anomaly (Ayshia) met with immediate success intersecting wide zones of high-grade Zn-Ag mineralization. Ongoing drill testing of this target has clearly confirmed the FLTEM interpretation and outlined a significant new VMS discovery which remains open at depth and along strike.
